

FreePBX Docker Installation Guide

This document provides step-by-step instructions to build and run the FreePBX Docker container.

Steps to Run FreePBX Container

Open a terminal and navigate to the FreePBX project directory.

1. Build the Docker container image using Docker Compose:

- `sudo docker-compose build`

2. Start the container in detached mode:

- `sudo docker-compose up -d`

3. Access the running container's shell:

- `sudo docker exec -it freepbx17 bash`

4. Once inside the container, run the FreePBX installation script:

- `bash sng_freepbx_debian_install.sh --skipversion`

Ensure all commands are run in the correct sequence for a successful FreePBX setup.
